# 1 Introduction

## 1.1 Model SN820X Module Family

The SN820X Module Family is a portfolio of low power, self-contained, embedded wireless module solutions that address the connectivity demands of M2M applications. These products integrate a micro-controller, a Wi-Fi BB/MAC/RF IC, an RF front end and two clocks into small form factor modules. The module family includes 2 different micro-controller options as shown below. The modules can also be purchased with either a standard on-board chip antenna or a U.FL connector where remote antenna flexibility is required.

### 3.2 GPIO Interface

The general purpose I/O (GPIO) pins available on the SN820X will connect to various external devices. GPIOs are configured as input floating by default. Subsequently, they can be programmed to be either input or output pins via the GPIO control register. They can also be programmed to have internal pull-up or pull-down resistors. The MICRO\_RST\_N pin is connected to a permanent pull-up resistor,  $R_{PU}$ .

### 3.3 Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to  $\pm 8$  mA, and sink or source up to  $\pm 20$  mA (with a relaxed VOL/VOH) except PC13, PC14 and PC15 which can sink or source up to  $\pm 3$  mA. When using the PC13 to PC15 GPIOs in output mode, the speed should not exceed 2 MHz with a maximum load of 30 pF.

- In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in Table 3.3.1.
- The sum of the currents sourced by all the I/Os on VDD, plus the maximum Run consumption of the MCU sourced on VDD, cannot exceed the absolute maximum rating IVDD.

**TABLE 3.3.1: Voltage Characteristics, SN820X**

Symbol	Ratings	Min	Max	U
V <sub>DD</sub> -V <sub>SS</sub>	External main supply voltage (including V <sub>DDA</sub> , V <sub>DD</sub> ) <sup>(1)</sup>	-0.3	4.0	V
V <sub>IN</sub>	Input voltage on five-volt tolerant pin <sup>(2)</sup>	V <sub>SS</sub> -0.3	V <sub>DD</sub> +4	
	Input voltage on any other pin	V <sub>SS</sub> -0.3	4.0	
ΔV <sub>DDx</sub>	Variations between different V <sub>DD</sub> power pins	-	50	mV
V <sub>SSx</sub> - V <sub>SS</sub>	Variations between all the different ground pins	-	50	
V <sub>ESD(HBM)</sub>	Electrostatic discharge voltage (human body model)		2000	V

1. All main power (V<sub>DD</sub>, V<sub>DDA</sub>) and ground (V<sub>SS</sub>, V<sub>SSA</sub>) pins must always be connected to the external power supply, in the permitted range.
2. V<sub>IN</sub> maximum value must always be respected.

**TABLE 3.3.2: Current Characteristics, SN8200/8200UFL**

Symbol	Ratings	Max.	Uni

$I_{VSS}$	Total current out of $V_{SS}$ ground lines (sink) <sup>(1)</sup>	150	
$I_{IO}$	Output current sunk by any I/O and control pin	25	
	Output current source by any I/Os and control pin	25	
$I_{INJ(PIN)}^{(2)}$	Injected current on five volt tolerant pins <sup>(3)</sup>	-5/+0	
	Injected current on any other pin <sup>(4)</sup>	± 5	
$\Sigma I_{INJ(PIN)}$	Total injected current (sum of all I/O and control pins) <sup>(5)</sup>	± 25	

**TABLE 3.3.3: Current Characteristics, SN8205/8205UFL**

Symbol	Ratings	Max.	Unit
$I_{VDD}$	Total current into $V_{DD}$ power lines (source) <sup>(1)</sup>	120	mA
$I_{VSS}$	Total current out of $V_{SS}$ ground lines (sink) <sup>(1)</sup>	120	
$I_{IO}$	Output current sunk by any I/O and control pin	25	
	Output current source by any I/Os and control pin	25	
$I_{INJ(PIN)}^{(2)}$	Injected current on five-volt tolerant I/O <sup>(3)</sup>	-5/+0	
	Injected current on any other pin <sup>(4)</sup>	±5	
$\Sigma I_{INJ(PIN)}^{(4)}$	Total injected current (sum of all I/O and control pins) <sup>(5)</sup>	±25	

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2. Negative injection disturbs the analog performance of the device.
3. Positive injection is not possible on these I/Os. A negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded.
4. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded.
5. When several inputs are submitted to a current injection, the maximum  $\Sigma I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values)

### 3.4 Output Voltage Levels

Unless otherwise specified, the parameters given in Table 3.4.1 and Table 3.4.2 are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions. All I/Os are CMOS and TTL compliant.

**TABLE 3.4.1: Output Voltage Characteristics, SN8200/SN8200UFL**

1. PC13, PC14, PC15 and PI8 are supplied through the power switch. Since the switch only sinks a limited amount of current (3 mA), the use of GPIOs PC13 to PC15 and PI8 in output mode is limited: the speed should not exceed 2 MHz with a maximum load of 30 pF and these I/Os must not be used as a current source (e.g. to drive an LED).

### 3.5 I<sup>2</sup>C Interface Characteristics

Unless otherwise specified, the parameters given below are derived from tests performed under ambient temperature, fPCLK1 frequency and VDD supply voltage conditions. The SN8200/8200UFL and SN8205/8205UFL performance line I<sup>2</sup>C interface meets the requirements of the standard I<sup>2</sup>C communication protocol with the following restrictions: the I/O pins to which SDA and SCL are mapped are not "true" open-drain. When configured as open-drain, the PMOS connected between the I/O pin and VDD is disabled, but is still present. The I<sup>2</sup>C characteristics are described in Table 3.5.1 and Table 3.5.2.

Symbol	Parameter	Test conditions	Typ	Max(2)	Unit
ET	Total unadjusted error	$f_{PCLK2} = 60$ MHz, $f_{ADC} = 30$ MHz, $R_{AIN} < 10$ k $\Omega$ , $V_{DDA} = 1.8^{(3)}$ to 3.6 V	$\pm 2$	$\pm 5$	LSB
E	Offset error		$\pm 1$	$\pm 2.5$	
E	Gain error		$\pm 1$	$\pm 3$	
ED	Differential linearity error		$\pm 1$	$\pm 2$	
EL	Integral linearity error		$\pm 1$	$\pm 3$	

1. Better performance could be achieved in restricted VDD, frequency and temperature ranges.
2. Based on characterization, not tested in production.
3. If IRROFF is set to VDD, this value can be lowered to 1.7 V when the device operates in the 0 to 70 °C temperature range.

**NOTE:** ADC accuracy vs. negative injection current: injecting a negative current on any analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents.

2. Ideal transfer curve.
3. End point correlation line.
4. ET = Total Unadjusted Error: maximum deviation between the actual and the ideal transfer curves.  
 EO = Offset Error: deviation between the first actual transition and the first ideal one.  
 EG = Gain Error: deviation between the last ideal transition and the last actual one.  
 ED = Differential Linearity Error: maximum deviation between actual steps and the ideal one.  
 EL = Integral Linearity Error: maximum deviation between any actual transition and the end point correlation line.

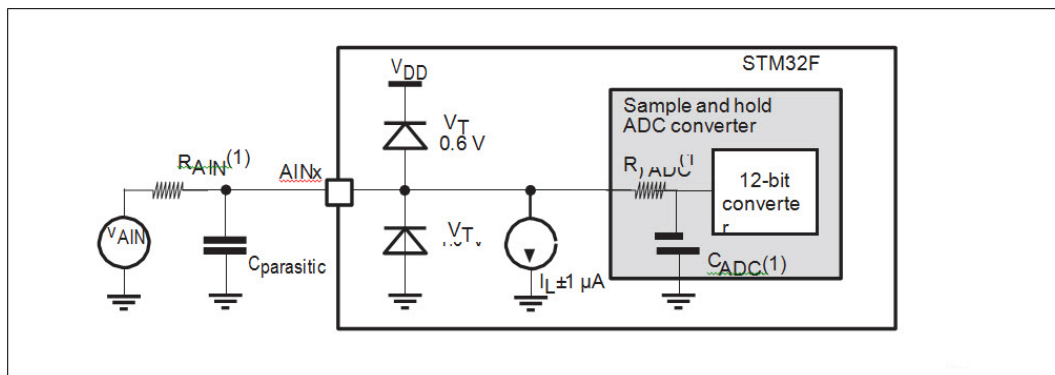

FIGURE 3.8: Typical Connection Diagram Using the ADC, SN8205/8205UFL

Cparasitic represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high Cparasitic value downgrades conversion accuracy. To remedy this, fADC should be reduced.
